

A close-up, low-angle shot of a basketball resting on a polished wooden floor. The basketball is brown with black lines and is positioned on the left side of the frame. The floor has a light wood grain and a black line runs across it. The background is dark and out of focus.

# Predicting NBA Success

General Assembly Data Science Immersive  
Capstone Project  
Matt Lee

**Can we accurately predict the NBA potential of college basketball players so that NBA teams can make the best use of their draft pick?**

# NBA DRAFT 2013

## NBA Draft

- 30 teams
- 2 rounds
- 60 picks

# What's the problem?

## 1st Round, 1st Pick

From top-left:

Anthony Bennett (2013), Kwame Brown (2001),  
Greg Oden (2007), Andrea Bargnani (2006)

## 2nd Round

From top-left:

Isaiah Thomas (2011, **60th**), Marc Gasol (2007, **48th**),

Draymond Green (2012, **35th**), Manu Ginobili (1999, **57th**)

# Significance of the draft

Once a year opportunity to add value

- Improve team roster
- Make history
- Boost ticket and merchandise sales
- Raise awareness to local community
- Aid and boost local community and economy

# Approach

- Collect pre-NBA data that can capture as many features of basketball players as possible
  - College basketball career average
  - Physical features
  - Demographic features
- Identify target metrics that can accurately represent the skill of an NBA player in his first five years of playing
- Generate an ordered list of players ranked by the predicted metric for team(s)

# Limitations

- Data acquisitions
  - Availability
    - Structured demographic data
    - High school/International players
  - Compatibility
    - No primary keys
    - Trades/transfers
  - Timing
    - Different eras
    - Measurement recording period
    - Deferred debuts/mid-career breaks
- Domain knowledge on target metric
  - No perfect statistic exists
  - Defense is hard to measure

# Target Metric

- Goal: Produced an ordered list, so teams know what they are getting in return
- To allow for flexibility, generate lists ranked in terms of:
  - Overall Skill
  - Offense
  - Defense
- Advanced basketball metrics (PER, Win Shares, Box +/-, VORP, etc.)
- To account for weaknesses, utilized dimensionality reduction (PCA) and unity-based normalization to generate one single metric for each list

# Target Metric - Timing

## Rookie Contract

*\* First round picks can sign for as much as 120% and as little as 80% of the rookie scale.*

Pick	1st Year Salary	2nd Year Salary	3rd Year Option Salary	4th Year Option: Percentage Increased Over 3rd Year Salary	Qualifying Offer: Percentage Increase Over 4th Year Salary
1	\$4,919,300	\$5,140,700	\$5,362,100	26.1%	30.0%
2	\$4,401,400	\$4,599,500	\$4,797,600	26.2%	30.5%
3	\$3,952,500	\$4,130,400	\$4,308,300	26.4%	31.2%

# Modelling

# Regression Problem

- Initially, ran trial models on all input variables
  - Linear Regressions, KNeighbors, Decision Tree, Ensemble and Boosted Regressors
- Data fitted better on linear models
  - Data transformation to reduce skewness and make patterns more linear
  - Utilized SelectKBest and models with regularization to identify key features
  - Train test split and K-Fold cross-validation
- Target metric combinations with unity-based normalization had better results than PCA

# Further Analysis

- Work with more data, especially demographic data
- Improve data cleaning process to increase sample size
- Utilize ensemble methods to incorporate predictions from different models
- Update and retrain model after every season and create pipeline that will generate predictions for incoming college players of that year

# Thanks!
